Snowflake Project – Data Engineering & SQL Solution

Date	29 October 2026
Team ID	Not provided — confirm from MySkillWallet/college
Project Name	EV Market Intelligence Dashboard
Maximum Marks	5 Marks

This section evaluates the quality and completeness of the implemented Snowflake solution. The submission should demonstrate that the data has been prepared, cleaned, transformed, validated, and made ready for downstream analysis..

Instructions

1. Ensure SQL scripts are well-structured, clearly organized, and follow appropriate SQL practices.
2. The solution should address the project requirements through the required data preparation and transformation steps.
3. Include all SQL scripts, table/view definitions, and setup information needed to reproduce the solution.
4. Provide evidence that the final Snowflake data is accurate, consistent, and ready for analysis.

Solution Summary

Field	Details
Project / Repository Link	Pending — add GitHub repository URL after creating/publishing the repository.
Data Source(s) Link	Supplied file: ev_market_test.csv (100,000 rows, 37 columns). Add the original MySkillWallet resource link if required.
Database	Not applicable to the current implementation. The project uses a CSV data source in Tableau Public; no Snowflake database was configured.
Warehouse	Not applicable — no Snowflake virtual warehouse was used.
Tables / Views Created	No Snowflake tables/views. Tableau

	worksheets/views: (1) Sales by category, (2) Top 10 EV manufacturers, (3) Battery technology mix, (4) Driving range by category, (5) Manufacturing country map, (6) Customer satisfaction, (7) Sales by model year, (8) Battery capacity vs. range, (9) Sustainability impact.
Key Transformations / Calculations	Tableau aggregations: SUM(Annual Sales Units), COUNT(Vehicle Id), AVG(Range Km), AVG(Customer Rating), AVG(CO2 Saved Tons Per Year). Manufacturer view uses a Top 10 filter. Category and manufacturer views are sorted for comparison. Nulls in measures should be excluded from averages; no source data was overwritten.
KPIs created	Total annual sales units by category/manufacturer/model year; record count by battery type; average range by category; average customer rating by category; average reported CO_2 savings by category; battery capacity versus range relationship.
Key Insights	Two-Wheeler Scooter has the highest category sales total (85,031,983). SurgeWorks leads the top-10 manufacturer view (4,883,639). NMC is the most frequent battery type (33,836 records). Luxury Sedan has the highest average range (~549 km). Crossover has the highest average customer rating (~4.10). 2021 has the highest yearly sales total (~88.09M). Electric Bus has the highest average reported CO_2 savings (~9.05 tons/year).

Snowflake Quality Checklist

S.No	Criteria	Status (Yes / No)

1	Required data is successfully loaded and accessible in Snowflake	Yes — CSV loaded into Tableau Public
2	Data is cleaned, transformed, and prepared appropriately	Partially — missing values identified; handling depends on the view and has not been fully documented as a separate cleaning pipeline
3	Required tables, views, and data relationships are correctly implemented	N/A — no Snowflake tables/views; Tableau worksheets are used
4	Required SQL logic, calculations, and KPIs are correctly implemented	Yes — aggregations and filters are used in Tableau; validate each view before submission
5	Data and solution outputs are validated against the project requirements	Partially — dataset-level checks and aggregate findings computed; screenshots/evidence should be attached
6	Solution is properly organized, documented, and functional	Partially — repository/documentation links are still pending

Additional Notes / Comments:

This supplied template is written for a Snowflake/SQL project, but the actual project instructions and work completed use Tableau Public with a CSV. Snowflake-specific fields are marked not applicable instead of claiming a database or warehouse that was not used. Do not submit SQL execution evidence unless SQL was genuinely performed.
