Performance Test

Date	29 October 2026
Team ID	Not provided — replace with actual MySkillWallet Team ID
Project Name	EV Market Intelligence Dashboard
Maximum Marks	As specified by course template

Project Performance Testing:

The project team shall fill the following information in the Project performance testing template.

S.No.	Parameter	Screenshot / Values
1.	Data Rendered	CSV source loaded in Tableau Public: ev_market_test.csv. Records: 100,000; fields: 37. File size: 23,238,435 bytes (22.16 MiB). No Snowflake tables were loaded; this project currently uses a local CSV source.
2.	Data Preprocessing & Quality	Checks run on source CSV: 9,511 missing cells across 5 columns; full-row duplicate records: 0; duplicate vehicle_id values: 0. No Snowflake SQL cleaning was performed. Missing values should be handled per chart/measure rather than blindly replaced with zero.
3.	New Fields Created	No Snowflake calculated fields. Tableau views use built-in aggregations: SUM(Annual Sales Units), COUNT(Vehicle Id), AVG(Range Km), AVG(Customer Rating), and AVG(CO2 Saved Tons Per Year). Confirm whether any calculated fields were manually created in Tableau before final submission.
4.	Filter Efficiency Test	Filters/views used include Top 10 manufacturers and any category, battery type, model year, or manufacturing-country filters actually added. Query-time comparisons are NOT available: Tableau Public is connected to CSV and no Snowflake query history/warehouse is configured. Do not report invented timings; if required, capture Tableau load/interaction timings manually and attach evidence.
5.	Dashboard & Visualization Testing	Nine visualisations are planned/created across the project: (1) sales by category, (2) top 10 manufacturers, (3) battery technology mix, (4) driving range by category, (5) manufacturing-country map, (6) customer satisfaction, (7) sales by model year, (8)

		battery capacity vs. range, (9) sustainability impact. Attach a full-dashboard screenshot and test filters, tooltips, labels, and fit on Tableau Public.
6.	Query History	Not applicable to the current implementation. No Snowflake SQL query history exists because the project uses a CSV in Tableau Public. If the evaluator expects Snowflake execution time, this template belongs to a different implementation and must be clarified with the course coordinator.

Implementation note: This template assumes Snowflake, but the submitted project workflow is Tableau Public + CSV. Snowflake-only metrics are explicitly marked not applicable rather than fabricated.
